Tom Hi, you can use the windows 7 usb installer to re-install windows 7. If you have your original cd that comes with your computer then you can re-install windows 7 to the cd drive instead of using the usb. You can download the windows 7 USB installer at [microsoft.com/windows/windows-7/download](http://microsoft.com/windows/windows-7/download) Hey! Did you guys check the compatibility with Win 7 Home Premium & Win 7 Enterprise on your machines? Thanks! 3. I have the same problem with Win 7 Enterprise. It has an E: drive, a CD drive, and a DVD drive and is recognized as two computers. I am trying to install it to one computer and i keep getting error 1322. I have another identical computer, but it is not listed as two computers. I tried to run the CD installer and it does not show as one computer. If you have 2 computers with the same OS name and model, then when you install, you can have an E: drive and a C: drive for both computers. Hi, Thank you very much! This solved my problem and worked very well. I have another question to ask you. I recently bought a new Toshiba Portege 4.0 Laptop and installed Win 7 Ultimate on it. The

---

Toshiba Drive E: is also there and was a part of the package. Everything went smooth until I wanted to install my 2nd hard drive for storage. Now I have only the C: drive of my laptop and it doesn't work at all. I tried to reinstall Win 7 and was also facing problems. This is the reason I couldn't boot from it. When I installed Win 7 to the C: drive, I could see the option of "Boot from Other Device" in the boot menu, but no matter which disk I select, it won't do anything. I am sorry, but I have to blame myself for this. I also noticed, it is almost the same problem as the one you described in this topic. Please let me know how to fix this. Thanks Yes, it is true. If you still can't get your new PC to boot from the install disk, try the same method, but this time connect the drive to an external SATA/USB enclosure and install the OS from there. 2. I also encountered this issue. But I tried what the 2nd poster said in the above mentioned topic and it worked. I am now able to boot from 82157476af
